1 Introduction

1.1 Project Summary

The goal of tkhis project is to build a dektop app that runs a cash register, handles inventory and manages an entire retail store. Creating and implementing a **WebAPI layer**, will allow the whole project to grow. This lauyer will be able to serve each kind of application (desktop, mobile, web, ...).

2 Initial Plan

2.1 Outline

The App is going to be build as a MVP (Minimum Viable Product) that can be expanded to cover all of the features, which are needed over time - so it can grow into a full featured application. First step is getting all of the major pieces set up, including:

- Git on Azure DevOps
- SQL Database (SSDT)
- WebAPI with Authentication
- WPF application that can log into the API

2.2 Technologies

- | | |
|--------------------------------|-------------------|
| • Unit Testing | • Async |
| • Dependency Injection | • Reporting |
| • WPF | • WebAPI |
| • MVVM with Caliburn Micro | • Logging |
| • ASP.NET MVC (Web Frontend) | • Data Validation |
| • .NET Framework | • HTML |
| • .NET Core 3.0 | • CSS |
| • SSDT - SQL Server Data Tools | • JavaScript |
| • Git | • Authentication |
| • Azure DevOps | |

3 Initial Setup in Visual Studio

1. Setting up a Git-Repository, including README, GitIgnore (for VS) and License
2. Creating a **Blank Solution**: Other Project Types → Blank Solution
Such type of solution isn't language specific.

4 Creating a WebAPI with Authentication

1. Adding new Project to the Solution:

Web → ASP.NET Web Application (.NET Framework) → WebAPI

Add folders and references for:

- MVC
- Web API

Change Authentication to

- Individual User Accounts

2. Upgrading all NuGet-Packages

4.1 Indentity Configuration

App_Start → IdentityConfig.cs

In there are some settings for setting up the WebAPI, especially for authentication:

- UserValidator
- PasswordValidator

4.2 Getting authorized for development

4.2.1 Postman

The following calls has to be applied in the given order:

1. POST

Creates a new user account and stores this information into the user database.
If **Status: 200 OK**, username and password has been succesfully created.

2. GET

GET http://localhost:54756/token

Params Authorization Headers (1) Body Pre-request Script Tests

none form-data x-www-form-urlencoded raw binary GraphQL BETA

	KEY	VALUE	DESCRIPTION
<input checked="" type="checkbox"/>	grant_type	password	
<input checked="" type="checkbox"/>	username	michael.kaip@gmx.net	
<input checked="" type="checkbox"/>	password	Pwd12345.	

It will return an **access_token** which is, by default, valid for 14 days. Token is needed for all further interaction with the server. Can be also configured for shorter valid periods.

3. POST

POST http://localhost:54756/api/values

Params Authorization Headers (1) Body Pre-request Script Tests

Headers (1)

	KEY	VALUE	DESCRIPTION
<input checked="" type="checkbox"/>	Authorization	Bearer VuQDu7NWP8J-yd-tCRvkiqFwjBMZlaURbN...	
	Key	Value	Description

Response

4.2.2 Getting User Information

In order to get the Identity of users returned, some changes have to be implemented. Through this it's becomes possible to apply different accessibility rules, based on the user-group a certain user is part of.

1. *RMDataManager.Controllers.ValuesController*

```
using System.Web.Http;
using Microsoft.AspNet.Identity; // Needed for getting information about the user

namespace RMDataManager.Controllers
{
    [Authorize]
    0 Verweise | 0 Änderungen | 0 Autoren, 0 Änderungen
    public class ValuesController : ApiController
    {
        // GET api/values
        0 Verweise | 0 Änderungen | 0 Autoren, 0 Änderungen
        public IEnumerable<string> Get()
        {
            // Stores the ID of each user
            var userId = RequestContext.Principal.Identity.GetUserId();
            return new string[] { "value1", "value2", userId };
        }
    }
}
```

5 Installing and configuring SWAGGER

SWAGGER is an API documentation and demonstration tool.

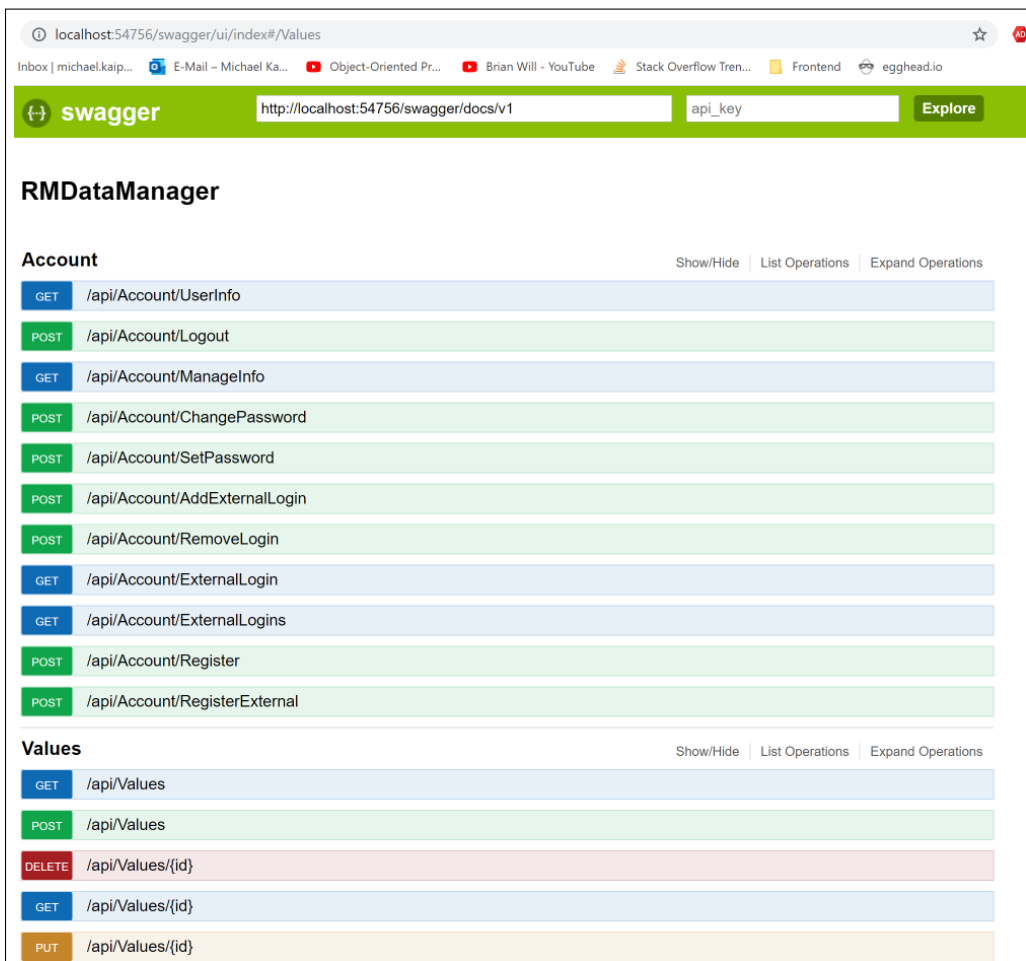

5.1 Installing SWAGGER

1. NuGet-Manager

Adds a SWAGGER to WebAPI-Projects.

2. Starting SWAGGER

5.2 Changing the configuration of SWAGGER

RMDDataManager.App_Start.SwaggerConfig.cs

1. Changing title

```
// Use "SingleApiVersion" to describe a single version API. Swagger 2.0 includes an "Info" object to
// hold additional metadata for an API. Version and title are required but you can also provide
// additional fields by chaining methods off SingleApiVersion.
//
c.SingleApiVersion("v1", title: "Retail Manager API"); // Changed to a proper name
```

2. Enabling proper printing of documents

```
// If you want the output Swagger docs to be indented properly, enable the "PrettyPrint" option.
//
c.PrettyPrint(); // enabled
```

3. Treating Enums as Strings

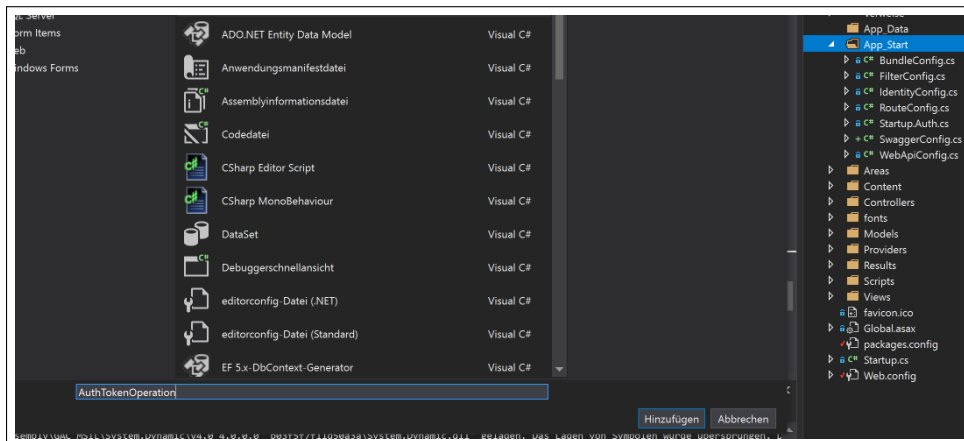

```
// In accordance with the built in JsonSerializer, Swashbuckle will, by default, describe enums as integers.
// You can change the serializer behavior by configuring the StringToEnumConverter globally or for a given
// enum type. Swashbuckle will honor this change out-of-the-box. However, if you use a different
// approach to serialize enums as strings, you can also force Swashbuckle to describe them as strings.
//
c.DescribeAllEnumsAsStrings(); // enabled
```

4. Changing document title

```
.EnableSwaggerUi(configure: c =>
{
    // Use the "DocumentTitle" option to change the Document title.
    // Very helpful when you have multiple Swagger pages open, to tell them apart.
    //
    c.DocumentTitle("RM API"); // changed the name
});
```

5.3 Adding OAuth ability

1. Enabling token endpoint allowance in the SWAGGER documentation

(a) Adding a new Class to `RMDataManager.App_Start`

(b) Implementing the required Interface

```

public class AuthTokenOperation : IDocumentFilter
{
    0 Version: 1.0 | 0 Änderungen | 0 Autoren, 0 Änderungen
    public void Apply(SwaggerDocument swaggerDoc, SchemaRegistry schemaRegistry, IApiExplorer apiExplorer)
    {
        swaggerDoc.paths.Add("/token", new PathItem
        {
            post = new Operation
            {
                tags = new List<string> { "Auth" },
                consumes = new List<string>
                {
                    "application/x-www-form-urlencoded"
                },
                parameters = new List<Parameter>
                {
                    new Parameter
                    {
                        type = "string",
                        name = "grant_type",
                        required = true,
                        @in = "formData",
                        @default = "password"
                    },
                    new Parameter
                    {
                        type = "string",
                        name = "username",
                        required = false,
                        @in = "formData"
                    },
                    new Parameter
                    {
                        type = "string",
                        name = "password",
                        required = false,
                        @in = "formData"
                    }
                }
            }
        });
    }
}

```

(c) Applying it to SwaggerConfig.cs

```

GlobalConfiguration.Configuration
    .EnableSwagger(c =>
    {
        c.DocumentFilter<AuthTokenOperation>(); // adding the implemented document filter
    }
)

```

(d) Logging into the application using SWAGGER and get the token

Retail Manager API

Account [Show/Hide](#) [List Operations](#) [Expand Operations](#)

Values [Show/Hide](#) [List Operations](#) [Expand Operations](#)

Auth [Show/Hide](#) [List Operations](#) [Expand Operations](#)

post /token

Parameters

Parameter	Value	Description	Parameter Type	Data Type
grant_type	password		formData	string
username	michael.kaip@gmx.net		formData	string
password	Pwd12345.		formData	string

[Try it out!](#) [Hide Response](#)

Curl

```
curl -X POST --header 'Content-Type: application/x-www-form-urlencoded' --header 'Accept: application/json' -d 'grant_type=password&username=michael.kaip@gmx.net&password=Pwd12345.'
```

Request URL

http://localhost:54756/token

Response Body

```
{
  "access_token": "MofCgsbIKqt10Nn1j4fhp4BuY3HfLYxt1qp-c3659v0LKzc-tME92xVP-McBT9d1UjZuHvEQPt1-4dQkKoxhKLQhMeSek8jM2SXX-pTr",
  "token_type": "bearer",

  "userName": "michael.kaip@gmx.net",
  ".issued": "Thu, 08 Aug 2019 12:18:18 GMT",
  ".expires": "Thu, 22 Aug 2019 12:18:18 GMT"
}
```

Response Code

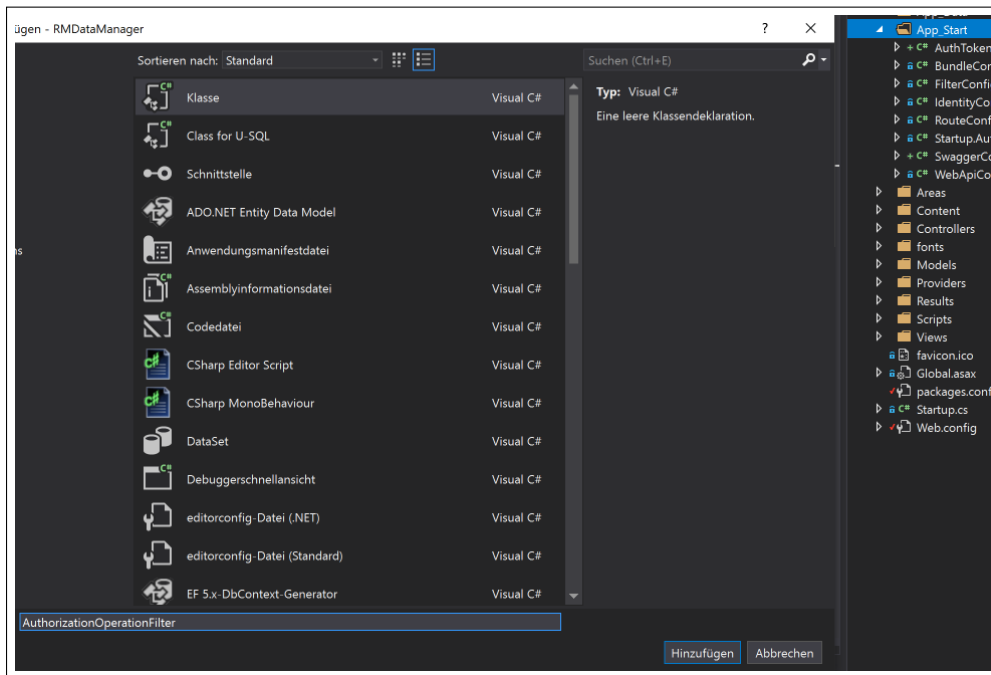

200

Response Headers

```
{
  "pragma": "no-cache",
  "date": "Thu, 08 Aug 2019 12:18:20 GMT",
  "server": "Microsoft-IIS/10.0",
  "x-powered-by": "ASP.NET",
  "content-type": "application/json; charset=UTF-8",
  "cache-control": "no-cache",
  "x-sourcefiles": "JUTF-8787FXxNYWnc5G9tZVxeb2N1bWVudMcUSR12G1bVx5ZXRhawxNYW5hZ2VybXFNRGF0YU1ibeaInZXJcdG9rZW4=?"",
  "content-length": "693",
  "expires": "-1"
}
```

2. Enabling to paste in the bearer token in order to authorize restricted commands

- (a) Adding a new Class to
- `RMDataManager.App_Start`

- (b) Implementing the required Interface

```

0 Verweise | 0 Änderungen | 0 Autoren, 0 Änderungen
public class AuthorizationOperationFilter : IOperationFilter
{
    0 Verweise | 0 Änderungen | 0 Autoren, 0 Änderungen
    public void Apply(Operation operation, SchemaRegistry schemaRegistry, ApiDescription apiDescription)
    {
        // Adding a parameter to each operation.
        if (operation.parameters == null)
        {
            operation.parameters = new List<Parameter>();
        }

        operation.parameters.Add(new Parameter
        {
            name = "Authorization",
            @in = "header",
            description = "access token",
            type = "string"
        });
    }
}

```

- (c) Applying it to SwaggerConfig.cs

```

.EnableSwagger(configure: c =>
{
    c.DocumentFilter<AuthTokenOperation>(); // adding the implemented document filter
    c.OperationFilter<AuthorizationOperationFilter>(); // adding the implmented operation filter
}

```

- (d) Get user information from the application via SWAGGER using the token

Values [Show/Hide](#) [List Operations](#) [Expand Operations](#)

GET /api/Values

Response Class (Status 200)
OK

Model: **Example Value**

```
[
  "string"
]
```

Response Content Type: application/json ▼

Parameters

Parameter	Value	Description	Parameter Type	Data Type
Authorization	bearer PbvcDU53IDWQvxxWnxBaBOs57EWMrT6	access token	header	string
